Effect of Yoga Therapy on Obesity

Introduction

Obesity is the most hazardous factor found in modern sedentary society and is a complex disorder of the modern world. It is emerged as the most prevalent sedentary lifestyle disorder in urban society. Excessive body weight is associated with various diseases particularly cardiovascular diseases, Type-2 Diabetes Mellitus, Obstructive sleep apnea, certain types of cancer osteoarthritis etc.

Yoga has been shown to be a simple and economical therapeutic modality that may be considered as a beneficial adjuvant for many of the health problems. Yoga therapy is the two fold therapeutic system that prevents and cures various diseases through practice of yoga system. This system concentrates on purification of body and mind, through this integrated holistic approach one can overcome almost all kinds of afflictions in life. It is a kind of low-impact physical exercise, and is used for therapeutic purposes \(^{(1,2,3)}\). Yogasanas have been practiced in India from Vedic period and was coordinated and organized in a systematic way, as known today, by Sage Pathanjali. He defined yoga as a systematic practice for purifying one’s mind, intellect and body.

In the present scenario, human beings are under threat from many chronic diseases, lifestyle disorders and non communicable diseases etc. A major cause of all these diseases was found to be improper lifestyle and stress. Excessive stress is known to cause hormonal imbalances and chemical imbalances in human body. It disturbs the...
metabolic activities and causes improper coordination of the metabolic and bio-chemical functions. One of the major fallouts of stress in the human body is excessive lipid peroxidation, indicating increased production of reactive oxygen species (ROS). Also during an immune response in the body, there is an increase in the production of ROS which will cause an imbalance in the body between ROS production and antioxidant defenses against the pathogen. Abnormally high levels of peroxidation and the simultaneous decline of antioxidant defense mechanisms can lead to damage of cellular organelles and oxidative stress\(^\text{4}\). Hence the natural balance between pro-oxidants and antioxidants will be shifted towards the oxidant side to cause further biological damage. As the oxidative stress increase, cell damage and accumulation of the toxic compounds in the body increases, leading to many pathological conditions.

According to tridosha theory in Ayurveda and Naturopathy literature, namely, Vatha, Pitta and Kapha are the structural and functional factors of the body, which govern the biochemical and physiological activities of the body. These three elements must be in a dynamic equilibrium with each other for the maintenance of health. Any imbalance of their relative equilibrium in the body results in disease. In human body Vatha dosha is responsible for all the physiological activities. Since yoga keeps the balance between ROS production and antioxidant defenses to prevent/ reduce oxidative stress, the present study was undertaken to find out the effect of intervention of yoga therapy in obese individuals.

Materials and Methods:
The present study was conducted to assess the effect of selected yogic practices in obese male and female subjects belong to the age group of 48 ± 13 years. The present study involved 40 obese individuals. All the subjects were comparatively new to yogic practices. The study was conducted in MRPL ladies club auditorium in the MRPL Township after an informed and written consent from all the participants. The research protocol was approved by institutional ethics committee. All the individuals were subjected to yoga practices for one month. The yoga practice was performed six days per week between 6 pm to 7 pm under the direct supervision of a trained yoga expert. This practical session utilized a standard sequence of selected Kriya, Asanas, Pranayamas and Relaxation Techniques, taking appropriate precautions for patients like Hypertension and back pain.

The various asanas included in the present study are Swastikasana, Vajrasana, Suptavajrasana, Tadasana, Trikonasana, Parshwakonasana, Paschimottanasana, Purvotthanasana, Ardhabadha padmasana, Janusirsasana, Mahamudra, Pavananuktasana, Bhujangasana, Dhanurasana, Viparitakarani and Uttanapadasana. The different pranayama techniques used were Ujjayi, Anuloma viloma and Bhastrika. The kriyas and relaxation techniques were Yoganidra and Agnisara respectively.

The Body Mass Index (BMI) was estimated in all the participants before and after the experimental procedure using the formula, \(\text{BMI} = \frac{\text{Weight in kg}}{\text{Height in meter}^2}\).

For biochemical estimations, about 5 ml of venous blood was collected from all the participants before and after the yoga practice and the serum was used for the estimation of fasting blood sugar, post prandial blood sugar, total antioxidant capacity and lipid peroxidation using commercially available kits.

Statistical Analysis: The data obtained was analyzed for the statistical significance using a paired \(^t\) test. \(p<0.05\) was considered the level of significance.

Results:
The present study involved the assessment of effect of
yoga therapy on obesity and oxidative status in obese individuals. The present study showed that the obese individuals reduced their Body Weight, Lipid Peroxidation, Blood Sugar and Total Antioxidant Level. The significant reduction in Body Weight (p=0.000, Fig-1), BMI (p=0.000, Fig-2), Fasting Blood Sugar (p=0.03, Fig-3) and post prandial blood sugar (p=0.000, Fig-4) after yoga when compared to that before the yoga therapy. This decline was the clear evidence that one month yoga therapy improved the metabolic and biochemical mechanisms in obese individuals. A significant reduction in the level of MDA (p=0.000, Fig-5) was also recorded in the present study. We also observed a significant increase (p=0.021, Fig-6) in the level of Total Antioxidant after yoga when compared to that before the yoga therapy, which further indicates that one month yoga therapy improves the biochemical and metabolic functions in the body.

Discussion:
The present study confirmed the positive effects of yoga therapy as a conventional modality of treatment on biochemical imbalances and oxidative status in obese subjects.

Body Mass Index provides a simple numeric measure of a person's "fatness" or "thinness", allowing health professionals to discuss over- and under-weight problems more objectively with their patients. Excessive body weight is associated with various diseases, particularly cardiovascular diseases, Type-2 Diabetes mellitus, Obstructive sleep apnea, certain types of cancer, and osteoarthritis. As a result, obesity has been found to reduce life expectancy. Obesity is most commonly caused by a combination of excessive food intake, lack of physical activity, and genetic susceptibility, although a few cases are caused primarily by genes, endocrine disorders, medications or psychiatric illness. Obesity is one of the leading preventable causes of death worldwide. On an average, obesity reduces life expectancy by six to seven years; a BMI of 30–35 reduces life expectancy by two to four years while severe obesity, BMI > 40 reduces life expectancy by 10 years.

The significant reduction in the Body Weight and BMI as recorded in the present study are in line with the earlier studies, wherein, a 6-day yoga program led to decreased body mass index (BMI), waist and hip circumference, fat-free mass, total cholesterol, high-density lipoprotein and fasting serum leptin levels, and 12 weeks of yoga led to an overall reduction in food consumption, in eating speed and in food choices. Eating disorder symptoms have also decreased following yoga, and in those diagnosed with an eating disorder, physical activity increased following yoga, and symptoms decreased, as did BMI and hip and waist measurements.

According to yoga, increased body mass is the indication of imbalance in the trigna and tridosha. The root causes of the abnormalities are adhi or mental stress. To overcome the stress the person habituates overeating leading to the deposition of fat in the body. To manage overweight or obesity, one has to reduce the mental stress and has to provide the sufficient physical activities. The practice of yoga can regulate all the body functions in a balanced manner and helpful in providing sustainable health. Analysis of our results clearly indicated that the complications of obesity can be reduced by yoga therapy. The reduction in the body weight might be due to reduction in the deposited fat on adipose tissue.

A reduction in the FBS and PPBS level after the practice of one month yoga indicated the improvement in the biochemical functions in obese individuals. Our findings are similar to the findings of Malhotra et al. who showed that yoga asanas significantly decreased FBG concentrations in Type-2 Diabetic patients after forty days.

Lipid peroxidation being an important process of
Oxidative degradation of the lipids increases the oxidative stress in the body. Oxidative stress has been identified and proven to be the root cause of more than seventy different chronic degenerative diseases such as heart disease, cancer, stroke, diabetes, Alzheimer’s dementia, Parkinson’s disease, macular degeneration and other serious ailments. The significant reduction in lipid peroxidation as recorded after one month yoga therapy might be due to enhancing the antioxidant system of the body.

**Conclusion:**
The prevalence of obesity is increasing among all ages, including the elderly. Research has shown that both high BMIs and low BMIs indicate increased *morbidity* and mortality. Yoga therapy is beneficial in maintaining good health by regulating BMI, Oxidative status by improving the biochemical functions of the body and helpful to overcome the complications of obesity. Hence, from our study, it is concluded that the efficacy of yoga therapy on Body Weight, Fasting and Post Prandial blood glucose, Lipid peroxidation and Total Antioxidant status in obese individuals. This may have direct impact on the use of yoga therapy as a safe therapeutic modality in combating obesity.

![Graph 1: Effect of yoga therapy on body weight](image1)

**Figure-1:** The effect of yoga therapy on body weight. No. of individuals were 40. There was a significant decline (p=0.02) in body weight after yoga when compared to that before the yoga therapy.

![Graph 2: Effect of yoga therapy on Body Mass Index](image2)

**Figure-2:** The effect of yoga therapy on Body Mass Index. No. of individuals were 40. There was a significant decline (p=0.000) in BMI after yoga when compared to that before the yoga therapy.

![Graph 3: Effect of yoga therapy on Fasting Blood sugar](image3)

**Figure-3:** The effect of yoga therapy on Fasting Blood sugar. No. of individuals were 40. There was a significant decline in FBS (p=0.03) after yoga when compared to that before the yoga therapy.

![Graph 4: Effect of yoga therapy on Post Prandial Blood sugar](image4)

**Figure-4:** The effect of yoga therapy on Post Prandial Blood sugar. No. of individuals were 40. There was a significant decline in PPBS (p=0.000) after yoga when compared to that before the yoga therapy.
